Every solution begins with an idea. Part of our promise to our customers is the development of new ideas and further advancement of these until they are matured, implementable solutions that bring added value.

With our individual service agreements, successful spare parts management system and the principle of "predictive maintenance", we look forward to a happy cooperation with you.

The manufacturing process is developed in accordance with your specifications, taking into consideration manual assembly as well as semi- or fully automatic production requirements. In addition to series production, we also take care of all delivery logistics for you.

We can perform all essential electrical and mechanical tests - including EMC testing - in our own laboratory. Product certifications (e.g. CE, radio/wireless standards) are carried out in collaboration with internationally accredited laboratories.

Electrical prototypes are produced at the series production facilities in order to obtain a manufacture-optimized design at an early stage of development. Mechanical components, such as housings, operating control elements and connectors, can be manufactured using rapid prototyping methods.

Based on our many years of experience, our in-depth technological know-how and quality-assured procedural methods, we can offer you customized solutions that match your applications and that are derived after individualized analysis of your demands and needs. Working jointly with you, we design and develop high-quality and economical solutions.
